New generation

G6 PRO

More
aerodynamic and
power behind
each pedal stroke

LIGHTWEIGHT

-80gr

Less weight of the frame

The new G6 PRO Improves frame performance while maintaining frame weight due to improvements in layup and the HCIM (Hollow Core Internal Moulding) moulding process.

RIGIDITY

FDM
PRECISION FULL CARBON

Redesigned Carbon Layup

The improved carbon layup increases rider efficiency by improving rear end and head-tube stiffness as well marked improvements to shifting performance.

PERFORMANCE

Direct Mount

Shimano's Direct Mount brake is both more efficient and aerodynamic

The rear mounted brake has been moved to the base of the chain-stay/bottom bracket intersection which improves both brake efficiency and overall aerodynamics of the frame.

NEW DESIGN

D12 battery integrated

BH has designed a internal Di2 battery holder

New design of seat post* prepared for incorporating a D12 battery, notably improving the aesthetics of the bike.

BB386 EVO

* Optional 250mm G6 seat-post available, Standard G6 seat post length is 170mm.

Performance Drive Aero design

Devouring kilometres

The frames aerodynamic qualities and aggressive confidence inspiring design urge the rider to speed, accelerate and go all out, all while devouring kilometres.

From the first turn of the pedals, the G6 exhibits tremendous efficiency all while highlighting why small details are important in top-level competition.

The G6 has its own very personalized style and aggressive design profile which is founded upon the companies rich century old cycling heritage, a combination unmatched in the bicycling industry today.

We design and develop the frame from the inside out

Our innovative frame building technology allows BH to accurately control and optimize the material thickness throughout the entire frame design. Selecting the most appropriate carbon to support our targets for weight, stiffness and ride compliancy allow BH to achieve the engineered balance that our frames are known for.

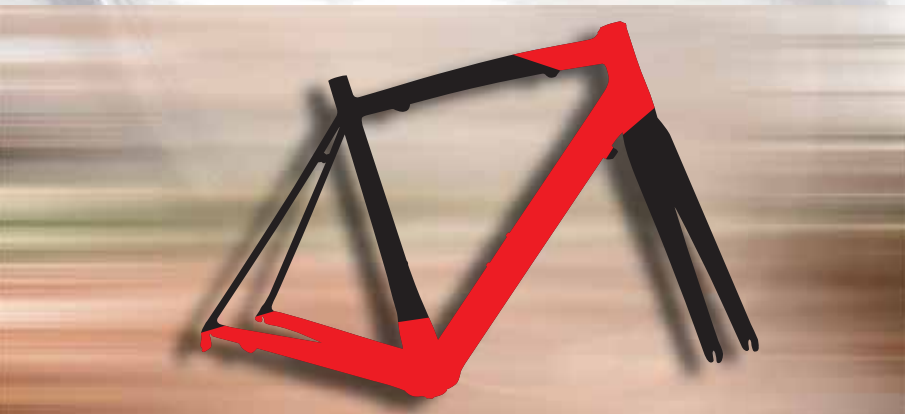

The result is a spectacular, lightweight yet aerodynamic design with exceptional rider power transfer and unparalleled vertical compliancy.

Oversized bottom bracket. Maximum lateral stiffness.

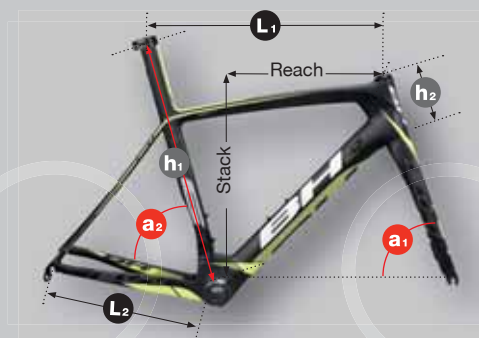

The G6 incorporates the BB386EVO bottom bracket system which is 86.5 mm wide which allows for full bearing support within the bottom bracket itself. This wider shell design allows for increased surface area for improved stiffness, rigidity and design flexibility. The result is exceptional lateral rigidity and improved stability, control and efficiency in each pedal stroke.

Sloping geometry. Optimal handling

The G6 frame utilizes a compact frame geometry that provides exceptional standover heights in all frame sizes and allows for greater torsional frame stiffness. The frames geometry was derived from years of development experience focused on building some of the best climbing bikes in the world that offer optimal handling, immediate acceleration and an overall confidence like nothing else in the industry.

Carbon device in the frame to obtain maximum rigidity and strength
